all structures infinite

<ロ> (四) (四) (三) (三) (三)

Nanocones

Equivalent structures

Definition

Two infinite structures are called *equivalent* iff a finite part in both of them can be removed so that the (infinite) remainders are isomorphic.

Nanocones

Each cone is equivalent to exactly one of the following cones (only caps shown)

- in fact the basic **very general** classification result is already from 1997 (Ludwig Balke)
- very easy (using Balke's result)
- very easy also for other structures you could e.g. immediately work out the classes for square-cones or even cones of more complicated periodic structures

- in fact the basic very general classification result is already from 1997 (Ludwig Balke)
- very easy (using Balke's result)
- very easy also for other structures you could e.g. immediately work out the classes for square-cones or even cones of more complicated periodic structures

Theorem (L. Balke (1997) rephrased for these circumstances)

A disordered periodic tiling is up to equivalence characterized by

- the periodic tiling *T* that is disordered (the hexagonal lattice in this case)
- a winding number (can be neglected here)
- a conjugacy class of an automorphism in the symmetry group of *T*

Follow the **same** path Ilrrrlrrlrrrr in the lattice

A counterclockwise rotation by 60 degrees

イロト イポト イヨト イヨト

ъ

A counterclockwise rotation by 60 degrees.

イロト イポト イヨト イヨト

agt

ъ

The path around two pentagons corresponds to the product of two paths – the rotation corresponds to the product of two rotations by 60 degrees.

イロト 不得 とくほ とくほう

This allows to determine possible equivalence classes.

Example: 3 pentagons

There are two such conjugacy classes in the symmetry group:

- rotation around the center of an edge
- rotation around the center of a face.

So two candidate classes.

イロト 不得 とくほ とくほう

This allows to determine possible equivalence classes.

Further classification

In the equivalence classes for nanotubes the region with the pentagons is bounded – the parameters of the class allow to compute upper bounds for this *disordered region*!

Aim

Take the localization of the defects also into account for cones. Classify by innermost paths of a certain form.

Nanocones

Definitions

Definitions

Assume 2 fixed.

Definition

A closed path of the form $((lr)^m r)^{6-p}$ (for some m) is called a symmetric path (for *p* and *m*).

• • • • • • • • • • • •

Definitions

Assume $2 \le p \le 5$ fixed.

Definition

A closed path of the form $((lr)^m r)^{6-p}$ (for some *m*) is called a symmetric path (for *p* and *m*).

Definition

A closed path of the form $((lr)^m r)^{6-p-1}((lr)^{m-1}r)$ (for some *m*) is called a nearsymmetric path (for *p* and *m*).

Definitions

Definition

A closed path in a cone is called a conepath if it is symmetric or nearsymmetric, shares an edge with a pentagon and has only hexagons in its exterior.

∃⇒

Finer classification of cones

Theorem

In every cone there is a unique cone path.

unless p = 2 and there is an nearsymmetric
 conepath.
 In this case there are exactly two isomorphic
 conepaths with isomorphic interior.

() > < </p>

Finer classification of cones

Theorem

So there is a 1-1 correspondence between caps (interiors of cone paths) and cones.

Note

The corresponding result does not hold for nanotubes.

∃⇒

A B > A B >

Finer classification of cones

Theorem

So there is a 1-1 correspondence between caps (interiors of cone paths) and cones.

Note

The corresponding result does not hold for nanotubes.

Sketch of the uniqueness proof

Brinkmann, Van Cleemput

Nanocones

Sketch of the uniqueness proof

Sketch of the uniqueness proof

Method

- if two conepaths exist, they are of the same *type* and share and edge *e*
- following the two paths in the lattice from the same starting edge gives the same endedge so $f(e, a_0, \dots, a_k) = f(e, a'_0, \dots, a'_k)$
- solve the equations for the different possible variables a_i

Construction of cone caps

But: lots of optimizations to increase efficiency

(日) (四) (日) (日) (日)

Construction of cone caps

But: lots of optimizations to increase efficiency

Brinkmann, Van Cleemput Na

Nanocones

イロト イポト イヨト イヨト

Construction of cone caps with two pentagons

All possible positions of the pentagons can be computed directly!

Idea

knowing the center of the rotation given by the boundary, one pentagon determines the position of the other

Construction of cone caps with two pentagons

Some results

Example: 3 pentagons, symmetric conepath

sidelength	number cones	min atoms	max atoms
5	18	58	82
10	124	163	261
15	387	318	542
20	915	523	921
25	1.757	778	1.402
30	3.039	1.083	1.981
35	4.793	1.438	2.662
40	7.164	1.843	3.441
45	10.162	2.298	4.322
50	13.955	2.803	5.301

CaGe

The program can be used inside the environment CaGe:

nanotubes nanocones		
symmetric	onnosymmetric	
Number of pentagons		
Length of longest Side	2	
🖌 isolated pentagons (ipr)		
✓ Add a number of hexagon layers	4.
